

TIE KINETIX

Business Integration Solutions

eVision 5.3

TIE Commerce's eVision products address the challenges of exchanging critical business data between and within organizations. EVision's powerful EDI/XML translation engine coupled with TIE Integrator's data integration functionality provide for greater collaboration between trading partners in the supply chain, increased efficiency, and reduced costs. TIE's solution simplifies data sharing by removing the restrictions—exchange data in any format with a fully automated and integrated system.

User-friendly

The drag-and-drop GUI mapper is easy-to-use, yet powerful enough for complex mapping. The translator provides a simple, easy to understand interface to control data flow and configure trading partner profiles. Use business rules to determine when processing occurs, schedule processes at designated intervals, or have them event driven.

More with Less

Free up valuable staff resources by setting up a "lights out" operating mode—receive notifications via Email or pager when processing exceptions occur. The high-speed data translation engine processes data in large volumes essential for meeting the demands of eCommerce today.

Speed

Full implementation in weeks rather than months, improving the overall efficiency of IT resources. Access information quickly—track documents by trading partner and access audit information at the click of a button or via automated reports.

Comprehensive

Achieve greater control, processing more than one document at a time with multiprocessing functionality. Application adapters connect eCommerce with Epicor business applications—. Multiple communication protocols provide connections with anyone, anytime, anywhere: async, bisync, FTP, AS2, HTTP/S, FTP/S, VANs, and direct connect.

Flexible

Integrate disparate systems with TIE Integrator. Easily migrate data between application databases and virtually any other format, plus the 100% Java application is platform independent and deployable throughout the enterprise.

TIE KINETIX

Remove the Barriers to Free Flowing Data

Is all your data within your grasp? Whether the data is internal or external, TIE Integrator can access the data you need in any format—on any platform. Adding TIE Integrator to your eVision Net/Server or Enterprise system can be a catalyst to data sharing, comprehensive reporting, and automating business processes.

“eVision is a very superior EDI/eCommerce tool which gives users the ability to manipulate files without having to learn a scripting language. Going from a test to production environment is quicker with eVision and there is no need to purchase additional “add on” software.”

Lisa Stinebuck - EDI Specialist
Perfetti Van Melle USA Inc.

Exchange Data at the Rate You Do Business.

Accelerate your trading partner relationships with the power of TIE Commerce’s eVision Enterprise. This dynamic tool removes the EDI processing barriers that hinder rapid translation and document exchange. In addition, with Enterprise you can move trading partners who need priority document handling to the front of the line. Whether you are new to TIE products or are upgrading from eVision Net/Server, you can transact data as quickly as your business demands using eVision Enterprise.

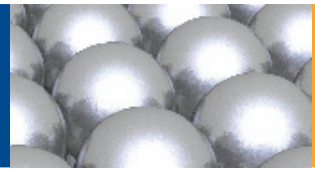

Speed of Processing

The multi-processing capabilities of Enterprise allow you to process documents simultaneously. Running more than one process concurrently increases the throughput of your application data. Plus, the Mailbox feature allows you to launch real time, event-driven processing—you process documents as soon as they hit the Mailbox. With Enterprise you can match the speed of your growing eCommerce needs.

Prioritize Trading Partners and Documents

In every business there are some trading partners that require immediate attention. With Enterprise you can set rules to process all documents for a trading partner before any other document. Once your business rules are established, you assign higher priorities to your most critical documents and trigger transaction processing as soon as they arrive.

TIE eVision Enterprise: Speed to Market

Leverage Your Investment

Already own eVision Net/Server? You can leverage your existing investment and add valuable functionality by upgrading to Enterprise. There's no need to reconfigure your eVision system. Existing maps and workflows continue to function as usual, plus all your custom scripts won't need to be rewritten. The new features work with existing functionality to streamline your data transformation.

Powerful Design

TIE Integrator was designed to work with eVision products to integrate disparate systems. Though complex in its design, it's an easy-to-use application that can track, transform and route data passing through your company's information systems. This 100% Java application is platform independent and deployable throughout your enterprise.

Seamless Infrastructure

Facilitate data sharing and transformation; efficiently and seamlessly share relevant information throughout your enterprise. With TIE Integrator, you achieve complete data integration 50% faster than custom, hand-coded solutions. You can easily connect business applications, exchange XML documents, and implement processing rules for both internal and external clients—experience the advantage of true data integration.

"Quick document turn-around is critical to our business. eVision Enterprise allows us send Advanced Ship Notices and Invoices as soon as Orders arrive."

Lisa Stinebuck
